

Automate Your Customer FAQs

The Problem

Your customers ask the same questions repeatedly. Your support team (or you) answers them over and over. A chatbot from a big vendor costs thousands per month, doesn't understand your specific products, and feels generic.

What You Get

A customer-facing FAQ bot trained on your documentation, knowledge base, and product info. Customers type their question and get an instant answer with sources — 24/7, in any language your docs are in.

It's built on your data, not a generic template. When a customer asks about your specific product, it actually knows the answer.

How It Works

1. **Send me your docs** — FAQ pages, knowledge base articles, product manuals, support transcripts
2. **I build the bot** — Trains on your content, deploys a clean chat interface
3. **You embed it** — On your website, in your app, or as a standalone help page

The Investment

€3,000 flat. Delivered in 2 weeks.

Includes: - Customer-facing chat interface - Document ingestion pipeline (PDF, DOCX, TXT, web pages) - Self-hosted vector database (your data stays yours) - Multi-language support if your docs are in multiple languages - Docker deployment + 30 days post-delivery support
