

Automate One Repetitive Task with AI

The Problem

You have a task that eats up hours every week: reading emails and sorting them, extracting data from PDFs, summarizing meeting notes, processing forms, categorizing leads. You could hire someone to do it manually — or you could automate it.

What You Get

A custom AI tool that does one specific task end-to-end. You give it the input, it gives you the output. No chatbot, no dashboard — just a tool that does the thing.

Examples: - Extract invoice data from PDFs → structured CSV - Read incoming emails → categorize and summarize - Process application forms → extract key fields - Summarize long reports → bullet-point briefs

How It Works

1. **Tell me the task** — What input do you have? What output do you need?
2. **I build the tool** — AI agent or script that automates the workflow
3. **You run it** — Via web interface, API, or command line

The Investment

€1,500-€2,500 flat. Delivered in 1 week.

Price depends on complexity. Includes: - Working tool tailored to your specific workflow - Clear documentation on how to run it - Docker deployment if needed - 30 days post-delivery support

Ready?

Send me a message describing the task you want automated. I'll tell you if it's a fit and what it would cost.
